

IN THE CLAIMS

Please re-write the claims to read as follows:

- 1 1. (Currently Amended) Apparatus for tightly-coupling hardware data encryption  
2 functions with software-based protocol decode processing within a pipelined processor of  
3 a programmable processing engine in a network switch, the apparatus comprising:  
4 an encryption execution unit contained within the pipelined processor;  
5 an ALU, in response to reading an op-code, enables the encryption execution unit  
6 to read data from a memory shared by the ALU and the pipelined processor, and for the  
7 encryption execution unit to process the data read from the shared memory; and  
8 a multiplexer to select as an output a ~~[[the]]~~ result of processing by the en-  
9 crypton execution unit rather than a result of ALU processing.

1 2. (Original) The apparatus of Claim 1 wherein the encryption execution unit is an en-  
2 crypton tightly coupled state machine (TCSM) unit that is selectively invoked within the  
3 pipelined processor.

1 3. (Currently Amended) The apparatus of Claim 2 [[wherein a software portion of the  
2 interface comprises]] further comprising:

3 native encryption opcodes provided within an instruction set of the pipelined  
4 processor to enable selective access to the encryption TCSM unit by software.

1 4. (Currently Amended) The apparatus of Claim 3 [[wherein the resources include]] fur-  
2 ther comprising:

3 a plurality of busses internal to the pipelined processor and wherein a hardware  
4 portion of the interface allows the encryption TCSM unit to utilize the internal buses in  
5 response to decode processing of the native encryption opcodes.

1 5. (Currently Amended) The apparatus of Claim 4 wherein the pipelined processor is a  
2 microcontroller core (TMC) processor having a multi-stage pipeline architecture that in-  
3 cludes an instruction fetch stage, an instruction decode stage, an execution stage and a  
4 memory write-back stage.

1 6. (Original) The apparatus of Claim 5 wherein the TMC processor further includes an  
2 arithmetic logic unit, at least one internal register, an instruction fetch and decode unit  
3 and the encryption TCSM unit organized as a data path.

1 7. (Original) The apparatus of Claim 5 wherein the encryption TCSM unit comprises a  
2 data encryption standard (DES) functional component cooperatively coupled to a sub-key  
3 generation functional component.

1 8. (Original) The apparatus of Claim 7 wherein the DES functional component com-  
2 prises state machine hardware used to execute each round of a DES function.

1 9. (Currently Amended) The apparatus of Claim 7 [[wherein]] further comprising:  
2 the sub-key generation functional component comprises state machine hardware  
3 that generates a sub-key as needed for each round of a [[the]] DES function.

1 10. (Previously Presented) A method for tightly-coupling hardware data encryption  
2 functions with software-based protocol decode processing within a pipelined processor of  
3 a programmable processing engine in a network switch, the method comprising the steps  
4 of:

5 providing an encryption execution unit within the pipelined processor;  
6 enabling, by an ALU in response to reading an op-code, the encryption execution  
7 unit to read data from a memory shared by the ALU and the pipelined processor, and for  
8 the encryption execution unit to process the data read from the memory; and  
9 selecting as output the result of processing by the encryption execution unit rather than  
10 selecting results from the ALU.

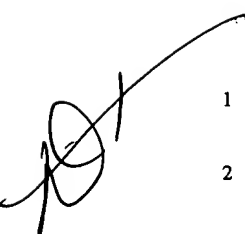

1 11. (Currently Amended) The method of Claim 10 [[wherein]] further comprising:

2 [[the integrated interface]]

3 having [[comprises]] native encryption opcodes contained within an instruction  
4 set of the pipelined processor; and

5       [[wherein the step of selectively accessing comprises the step of]]

6           issuing the native encryption opcodes directly to the encryption execution unit to  
7       substantially reduce encryption setup latency.

1       12. (Original) The method of Claim 11 further comprising the steps of, wherein the  
2       pipelined processor is a microcontroller core (TMC) processor having a multi-stage pipe-  
3       line architecture that includes an instruction decode stage and an execution stage:  
4           decoding the native encryption opcodes at the instruction decode stage; and  
5           in response to the step of decoding, invoking the encryption execution unit to per-  
6       form encryption/decryption functions at the execution stage.

1       13. (Original) The method of Claim 12 further comprising the steps of, wherein the en-  
2       cryption/decryption functions are performed on plaintext stored at the network switch:  
3           protocol processing of protocols contained in the plaintext to determine an appro-  
4       pate encryption algorithm;  
5           upon determining the appropriate encryption algorithm, immediately starting an  
6       operation to fetch initial keys needed to perform the encryption/decryption functions; and

7        upon fetching the keys, providing the keys to the encryption execution unit within  
8        the TMC processor.

1        14. (Original) The method of Claim 13 further comprising:

2        [[wherein the resources include]]

3        including a plurality of high-performance busses internal to the TMC processor;

4        and

5        [[, and wherein the step of invoking comprises the step of:]]

6               accessing the internal busses [[through the integrated interface]] to simultane-  
7        ously load an encryption key and store a previous encryption result.

1        15. (Currently Amended) The method of Claim 12 further comprising the step of,  
2        wherein the [[the]] encryption execution unit is an encryption tightly coupled state ma-  
3        chine (TCSM) unit:

4               initializing the encryption TCSM unit in response to execution of a first instruc-  
5        tion that defines the form of operation to be performed.

1 16. (Original) The method of Claim 15 wherein the encryption TCSM unit comprises a  
2 data encryption standard (DES) functional component cooperatively coupled to a sub-key  
3 generation functional component and wherein the step of initializing comprises the steps  
4 of:

5 decoding a first portion of the first instruction to initialize the DES functional  
6 component; and

7 decoding a second portion of the first instruction to initialize the sub-key genera-  
8 tion functional component.

1 17. (Original) The method of Claim 16 further comprising the step of:

2 executing a second instruction having a micro-opcode field containing a native  
3 encryption opcode that specifies loading an initial key from a memory into the sub-key  
4 generation functional component of the encryption TCSM unit.

1 18. (Currently Amended) The method of Claim 17 further comprising the step of:

2 performing a DES function on a [[the]] plaintext in response to execution of a  
3 third instruction having a micro-opcode field containing a native encryption code that  
4 specifies loading of the plaintext into the DES functional component of the encryption  
5 TCSM unit and initiating DES operations; and  
6 upon completing the DES operations, storing a ciphertext result [[results]] in  
7 an internal register coupled to the DES functional component.

1 19. (Original) The method of Claim 18 further comprising the step of:  
2 executing a fourth instruction to store the ciphertext results contained in the inter-  
3 nal register to a location in the memory.

1 20. (Previously Presented) A programmable processing engine of a network switch  
2 comprising:  
3 an input header buffer;  
4 an output header buffer; and

5 a plurality of processing complex elements symmetrically arrayed into rows and  
6 columns that are embedded between the input header buffer and an output header buffer,  
7 each processing complex element comprising a microcontroller core having an encryp-  
8 tion tightly coupled state machine (TCSM) unit that is selectively invoked in response to  
9 the microcontroller reading an op-code; and

10 a selector to select an output from either the microcontroller OR the TCSM.

1 21. (Currently Amended) A pipelined processor in a network switch, the processor  
2 comprising:

3 an ALU internal to the processor responsive to a first set of opcodes;

4 an encryption execution unit internal to the processor having an encryption tightly  
5 coupled state machine (TCSM) responsive to a second set of opcodes, the ALU, in re-  
6 sponse to an op-code, transferring processing to the encryption execution unit to process  
7 in response to said second set of opcodes;

8 a multiplexer to select output from the ALU OR from the encryption execution  
9 unit.

1 22. (Previously Presented) The processor of Claim 21, wherein the processor is a mi-  
2 crocontroller core (TMC) processor and further comprises:  
3 an instruction fetch stage;  
4 an instruction decode stage to decode an instruction fetched by the instruction  
5 fetch stage;  
6 an execution stage to execute a decoded instruction; and  
7 a memory write-back stage to write a result of said execution stage to memory.

1 23. (Currently Amended) The processor of Claim 21, further comprises [[com-  
2 prise]]:  
3 one or more internal registers;  
4 a bus operatively connecting [[the]] one or more internal registers to both the  
5 ALU and the encryption execution unit; and  
6 a multiplexer having inputs from both the ALU and the encryption execu-  
7 tion unit, the multiplexer outputting a selected input.

1 24. (Previously Presented) The processor of Claim 21, wherein the encryption  
2 TCSM unit comprises:  
3 a data encryption standard (DES) functional component cooperatively coupled to  
4 a sub-key generation functional component.

1 25. (Previously Presented) The processor of Claim 24, wherein the DES functional  
2 component comprises:  
3 a state machine that executes each round of a DES function.

1 26. (Currently Amended) The processor of Claim 24, wherein the sub-key generation  
2 functional component comprises:  
3 a state machine that generates a sub-key as needed for each round of a a [[the]]  
4 DES function.

1 27. (Currently Amended) A method for providing encryption functions within a pipe-  
2 lined processor in a network switch, the method comprising the steps of:

3 associating a first set of opcodes with an ALU internal to the processor;

4 associating a second set of opcodes with an encryption execution unit internal to  
5 the processor ~~[[process]]~~ or having an encryption tightly coupled state machine

6 (TCSM), wherein protocol processing operations are performed by the ALU and encryp-  
7 tion operations are performed by the encryption execution unit in response to said second  
8 set of opcodes; and

9 transferring by the ALU, in response to an op-code, processing to the encryption  
10 execution unit to process encryption operations in response to said second set of op-  
11 codes;

12 selecting output from the ALU OR from the encryption execution unit.

1 28. (Currently Amended) The method of Claim 27, further comprises ~~[[comprise]]~~  
2 the step of:

3 providing one or more internal registers;

4 providing a bus operatively connecting the one or more internal registers to both  
5 the ALU and the encryption execution unit;

6 providing a multiplexer having inputs from both the ALU and the encryption exe-  
7 cution unit, the multiplexer outputting a selected input.

1 29. (Previously Presented) The method of Claim 27 further comprising the step  
2 of:

3 initializing the encryption TCSM unit in response to a first instruction that defines  
4 a form of operation to be performed.

1 30. (Currently Amended) The method of Claim 29, wherein the step of initializing com-  
2 prises the steps of:

3 decoding a first portion of the first instruction to initialize a [[the]] DES func-  
4 tional component; and

5 decoding a second portion of the first instruction to initialize a [[the]] sub-key  
6 generation functional component.

1 31. (Currently Amended) The method of Claim 27, further comprising the steps of:

2 executing a second instruction including an encryption opcode that specifies

3 loading an initial key from a memory into a a ~~[[the]]~~ sub-key generation functional com-

4 ponent of the TCSM unit.

1 32. (Currently Amended) The method of Claim 27, further comprising the steps of:

2 performing a DES function in response to execution of a third instruction having a

3 field containing an encryption opcode that specifies loading plaintext and initalizing

4 ~~[[initialing the]]~~ a DES operation ~~[[operations]]~~.

1 33. (Currently Amended) A computer readable media, comprising:

2 said computer readable media containing instructions for execution in a processor

3 for the practice of the method of, [[claim 10 or claim 27 or claim 40]]

4 providing a tightly-coupling hardware data encryption function with software-

5 based protocol decode processing within a pipelined processor of a programmable proc-

6 essing engine in a network switch;

7 providing an encryption execution unit within the pipelined processor;

8 enabling, by an ALU in response to reading an op-code, the encryption execution

9 unit to read data from a memory shared by the ALU and the pipelined processor, and for

10 the encryption execution unit to process the data read from the memory; and

11 selecting as output the result of processing by the encryption execution unit rather

12 than selecting results from the ALU.

1 34. (Currently Amended) Electromagnetic signals propagating on a computer net-  
2 work, comprising:

3 said electromagnetic signals carrying instructions for execution on a processor for  
4 the practice of the method of, [[claim 10 or claim 27 or claim 40]]

5 providing a tightly-coupling hardware data encryption function with software-  
6 based protocol decode processing within a pipelined processor of a programmable proc-  
7 essing engine in a network switch;

8 providing an encryption execution unit within the pipelined processor;

9 enabling, by an ALU in response to reading an op-code, the encryption execution  
10 unit to read data from a memory shared by the ALU and the pipelined processor, and for  
11 the encryption execution unit to process the data read from the memory; and

12 selecting as output the result of processing by the encryption execution unit rather  
13 than selecting results from the ALU.

1 35. (Previously Presented) A router, comprising:

2 a processor having an ALU for processing op-codes and a tightly coupled state  
3 machine (TCSM) for performing encryption processing;

4 a shared memory for providing data to either the ALU or the TCSM;

5 the ALU, in response to reading an op-code, transferring processing to the TCSM,  
6 and the TCSM performing encryption processing on data read from the shared memory;  
7 a selector to select as output results from the ALU OR results from the TCSM.

1 36. (Previously Presented) The apparatus of Claim 35, further comprising:  
2 the selector is a multiplexer.

1 37. (Previously Presented) The apparatus of Claim 35, further comprising;  
2 the ALU selects whether the ALU or the TCSM reads data from the memory.

1 38. (Previously Presented) The apparatus of Claim 35, further comprising:  
2 the TCSM performs DES data encryption standard encryption processing.

1 39. (Previously Presented) The apparatus of Claim 35, further comprising:  
2 a sub-key generation component to provide a key to the TCSM.

1 40. (Previously Presented) A method for operating a router, comprising:  
2 providing a processor having an ALU for processing op-codes and a tightly cou-  
3 pled state machine (TCSM) for performing encryption processing;  
4 reading data from a shared memory by either the ALU or the TCSM;  
5 transferring processing by the ALU, in response to reading an op-code, to the  
6 TCSM, and the TCSM performing encryption processing on data read from the shared  
7 memory;  
8 selecting as output results from the ALU OR results from the TCSM.

1 41. (Previously Presented) The method of Claim 40, further comprising:  
2 using a multiplexer for selecting as output results from the ALU OR results from  
3 the TCSM.

1 42. (Previously Presented) The method of Claim 40, further comprising;  
2 selecting by the ALU whether the ALU or the TCSM reads data from the mem-  
3 ory.

1 43. (Previously Presented) The method of Claim 40, further comprising:  
2 performing DES data encryption standard encryption processing by the TCSM.

1 44. (Previously Presented) The method of Claim 40, further comprising:  
2 providing key to the TCSM by a sub-key generation component.

1 45. (Previously Presented) A router, comprising:  
2 means for providing a processor having an ALU for processing op-codes and a  
3 tightly coupled state machine (TCSM) for performing encryption processing;  
4 means for reading data from a shared memory by either the ALU or the TCSM;  
5 means for transferring processing by the ALU, in response to reading an op-code,  
6 to the TCSM, and the TCSM performing encryption processing on data read from the  
7 shared memory;  
8 means for selecting as output results from the ALU OR results from the TCSM.

1 46. (Previously Presented) The apparatus of Claim 45, further comprising:  
2 means for using a multiplexer for selecting as output results from the ALU OR  
3 results from the TCSM.

1 47. (Previously Presented) The apparatus of Claim 45, further comprising;  
2 means for selecting by the ALU whether the ALU or the TCSM reads data from  
3 the memory.

1 48. (Previously Presented) The apparatus of Claim 45, further comprising:  
2 means for performing DES data encryption standard encryption processing by the  
3 TCSM.

1 49. (Previously Presented) The apparatus of Claim 45, further comprising:  
2 means for providing key to the TCSM by a sub-key generation component.

Please add new claims 50, *et seq.*, as follows:

50. (New) A computer readable media, comprising:
- said computer readable media containing instructions for execution in a processor for the practice of the method of providing encryption functions within a pipelined processor in a network switch, having the steps,
- associating a first set of opcodes with an ALU internal to the processor;
- associating a second set of opcodes with an encryption execution unit internal to the process or having an encryption tightly coupled state machine (TCSM), wherein protocol processing operations are performed by the ALU and encryption operations are performed by the encryption execution unit in response to said second set of opcodes; and
- transferring by the ALU, in response to an op-code, processing to the encryption execution unit to process encryption operations in response to said second set of op-codes;
- selecting output from the ALU OR from the encryption execution unit.

1 51. (New) Electromagnetic signals propagating on a computer network, comprising:  
2 said electromagnetic signals carrying instructions for execution on a processor for  
3 the practice of the method of providing encryption functions within a pipelined processor  
4 in a network switch, having the steps,

5 associating a first set of opcodes with an ALU internal to the processor;

6 associating a second set of opcodes with an encryption execution unit internal to  
7 the process or having an encryption tightly coupled state machine (TCSM), wherein pro-  
8 tocol processing operations are performed by the ALU and encryption operations are per-  
9 formed by the encryption execution unit in response to said second set of opcodes; and

10 transferring by the ALU, in response to an op-code, processing to the encryption  
11 execution unit to process encryption operations in response to said second set of op-  
12 codes;

13 selecting output from the ALU OR from the encryption execution unit.

1 52. (New) A computer readable media, comprising:

2 said computer readable media containing instructions for execution in a processor  
3 for the practice of the method of operating a router, having the steps,

4 providing a processor having an ALU for processing op-codes and a tightly cou-  
5 pled state machine (TCSM) for performing encryption processing;  
6 reading data from a shared memory by either the ALU or the TCSM;  
7 transferring processing by the ALU, in response to reading an op-code, to the  
8 TCSM, and the TCSM performing encryption processing on data read from the shared  
9 memory;  
10 selecting as output results from the ALU OR results from the TCSM.

1 53. (New) Electromagnetic signals propagating on a computer network, comprising:  
2 said electromagnetic signals carrying instructions for execution on a processor for  
3 the practice of the method of operating a router, having the steps,  
4 providing a processor having an ALU for processing op-codes and a tightly cou-  
5 pled state machine (TCSM) for performing encryption processing;  
6 reading data from a shared memory by either the ALU or the TCSM;  
7 transferring processing by the ALU, in response to reading an op-code, to the  
8 TCSM, and the TCSM performing encryption processing on data read from the shared  
9 memory;  
10 selecting as output results from the ALU OR results from the TCSM.
